

Newer anticonvulsants for the treatment of status epilepticus.

Eljim P. Tesoro

Department of Pharmacy Practice
College of Pharmacy
University of Illinois at Chicago, IL USA

Status epilepticus is associated with significant morbidity and mortality. Successful treatment depends on timely diagnosis and administration of appropriate medications. Initial therapy involves parenteral weight-based benzodiazepines followed by parenteral antiseizure medications. This session will review the data, pharmacology, and utility of recently approved drugs used in the setting of status epilepticus treatment.
